FAIR text analytics for every researcher: from a browser tab to your desktop

Dr Chao Sun · Dr Senhui (Alex) Guo

Sydney Informatics Hub, The University of Sydney

Language Data Commons of Australia (LDaCA)

LDaCA Wordflow

Open-source text analytics you drive by pointing and clicking, built for researchers who do not program.

Bring your text

CSV, Excel, text files and folders, or LDaCA's curated collections.

Analyse without programming

Clean and reshape your text, then find counts, contexts and patterns with Frequency, Concordance, Trends, Topics and Quotation.

Generative AI for qualitative coding

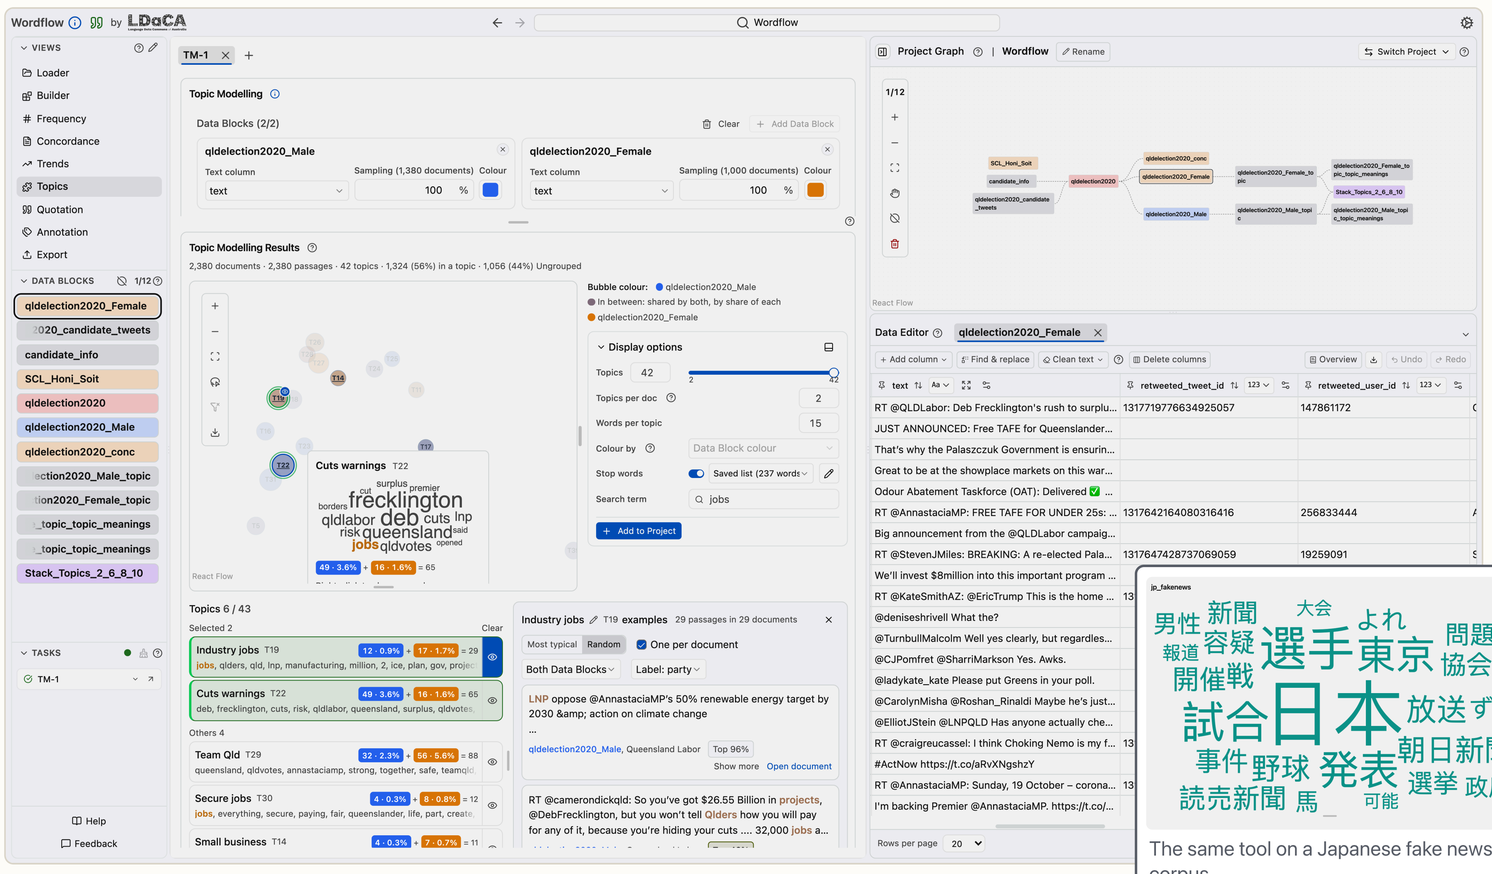

Code a sample by hand with your codebook, check that your coders agree, then let a large language model code the rest. Use popular commercial models, or open-source models run locally for data privacy and responsible research with AI.

Tools that work together

Any tool's result becomes a Data Block that another tool can analyse further. The Project graph maps how your data flows through every step, a record and a recipe of your method.

Any language

Chinese, Japanese and Korean tokenisers alongside English and other languages.

Topics in male and female candidates' tweets, 2020 Queensland election: named topics, the texts behind them, the Project graph and the data. Data: *Queensland Election 2020 on Twitter*, QUT Digital Observatory (ADO), doi.org/10.25912/RDF_1665115527020; candidate gender: Sydney Corpus Lab.

The same tool on a Japanese fake news corpus

From a browser tab to your desktop

one codebase, four ways to run it, the same Wordflow

Browser tab → Your desktop

1 ARDC Binder

Try it, teach with it · AU and NZ

Click a link, sign in with your institution (AAF, Tuakiri). Nothing to install.

2 Hosted web app

Resume anywhere · anyone

Sign in at **wordflow.ldaca.edu.au** through CILogon; your Projects wait for you on any computer.

3 Desktop app

Sensitive or large data · anywhere

Windows and macOS. Data stays on your machine; works offline.

4 One command

Set it up your way · anywhere

`uvx ldaca-wordflow` installs it from PyPI on any computer or server.

on national research infrastructure, free from any computer

on your own computer, under your full control

Download your Project from any of these and open it in another: the same Project, wherever you run Wordflow.

What makes it FAIR

how Wordflow puts the principles into practice

F Findable

- Every release on PyPI and archived on Zenodo with a DOI
- Public, versioned documentation

A Accessible

- Free and open source
- In a browser with an institutional sign-in, or offline on your desktop

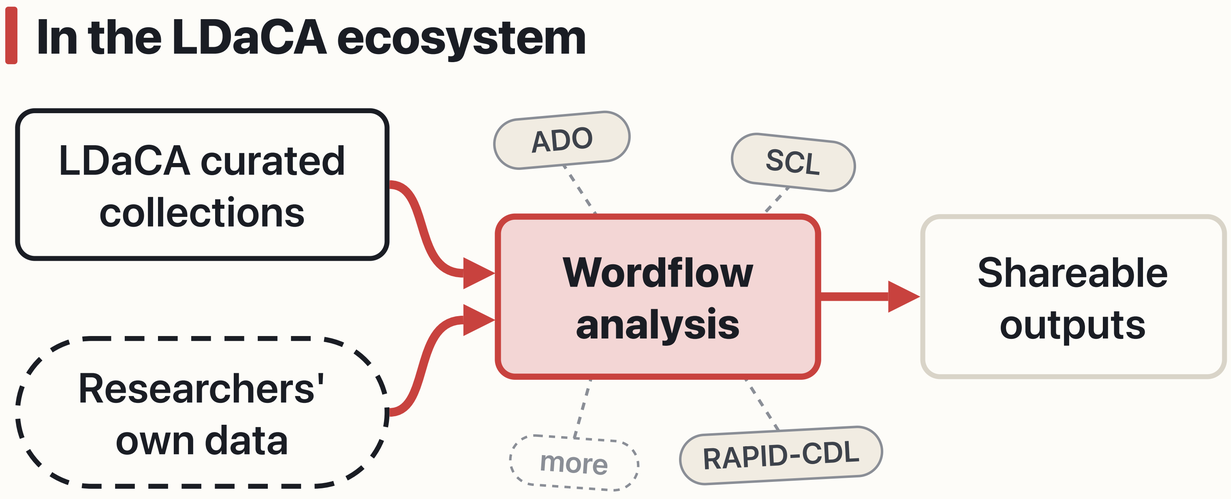

I Interoperable

- Open formats in and out (CSV, Excel)
- The same Project opens wherever Wordflow runs

R Reusable

- Every release keeps its own launch link, so you can rerun on the same version
- The Project graph records every step

In the LDaCA ecosystem

Two main sources: LDaCA's curated collections (with their access conditions) and researchers' own data. Partners such as the Australian Digital Observatory (ADO), the Sydney Corpus Lab (SCL) and RAPID-CDL contribute sample data.

Reach

to October 2026

7 workshops: 5 in person, 2 online

100+ pieces of user feedback

39 releases since May 2026, each with a DOI

400+ desktop app downloads, Windows and macOS

Try it now
wordflow.ldaca.edu.au

Ways to run it
landing page, downloads, source

Cite it
every release on Zenodo

DOI 10.5281/zenodo.20408328

Collaborate with us: we're keen to make Wordflow work for your research community, your data and your training programs.
